

Design-analysis metrics for each of the 48 meta-analysis models

Models are ordered by k, the number of effect-size estimates, which is also the weight used in the meta-analysis-level summary; leverage therefore reads top to bottom. Dashed rules mark those k-weighted summaries. MA09 (shaded) alone holds 22.6% of the weight, and dropping it moves the Yang-2024 summary from 0.479 to 0.693. All metrics use a common normal-theory two-sided 5% threshold ($z = 1.96$). Type S is not logged because it reaches $1e-90$; Type M is, because it reaches 4,260.
